

Panel Manufacturing

At Absolute Containers we offer panels for sale, ranging between various Chromadek, FRP, IBR, Stainless Steel and Aluminium panels. Our sophisticated cut to length panel manufacturing machine rolls forms to a unique tongue and groove joint which is then laminated using an industrial polyurethane adhesive to either a polystyrene, rod wool or poly urethane inner core. All insulated containers can be moved using a pallet jack or a crane truck.

We ensure quality materials are used in the manufacturing process which complies with environmental and international standards from sourcing of raw materials. Panel thickness and lengths are manufactured in accordance with room temperature requirements or client specifications. Panels allow for speedy and cost-effective manufacturing of insulated containers.

Spaza shops, internet café, kiosks and security booths are examples of units built on dipped galvanised base frames that are also equipped with doors, windows, and service hatches to meet client requirements.

Panels provide the base frame for prefabricated buildings that are manufactured according to meet engineers' specifications using stainless steel or mild steel lipped channel that has been dipped with galvanising to meet coastal specifications.
